Fibrosarcoma

Xenograft Tumor Model

**Model**

The athymic nude mouse has an autosomal recessive mutation on *nu* locus on chromosome 11. The hairless model is T-cell deficient and accepts xenograft transplantation.

**Cell Line**

Human KYSE-30 cells sourced from DSMZ® (Number: ACC 351) were implanted into a cohort of athymic nude mice. Female mice at approximately 8 weeks of age were implanted with 5.0×10⁶ cells with GFR Matrigel (1:1 dilution) into the subcutaneous space of the right flank.

**Tumor Growth in vivo**

The mice were maintained in a barrier under controlled environmental conditions. The mice consumed Teklad Global Rodent Diet 2914 (14% protein). Body weights were taken and tumor measurements were assessed with a caliper twice per week.
